

Diesel Fuel Conditioning System

The Algae-X conditioning system promises diesel engine users more power and less smoke while saving fuel. Maintenance and downtime are said to be reduced, while the life of an engine's injector system and fuel pump are extended. Fuel to a diesel-powered generator or heating system also can be conditioned by the same Algae-X unit.

According to product literature, repeated exposure to the heat and pressure of the injection system and temperature changes in the tank accelerate fuel quality degradation. The Algae-X fuel conditioning system reportedly reverses the process of fuel breakdown, improves fuel filterability, and cleans the total fuel system when the engine is running. The Algae-X unit, with its powerful magnetics, is installed between the tank and the primary filter. It is self-cleaning, has no moving parts or electrical hookups, and requires no maintenance. The device is covered by a lifetime warranty.
