

I now have about 5 hours on the Algae X unit and the AFC-705 catalyst. I can report the following:

No smoke on startup (except for an initial puff). Minor white smoke on starboard engine at idle after a long run at 3300rpm. (This minor white puff appears after about 10 minutes) No soot on the transom after 5 hours. Minor darkening of marlin board rim. No soot on transom under the marlin board. Before, the port engine practically shook itself to death on an initial cold start. Now there's none of that. Engines have a crisper noise at idle and seem to idle better. You can hear the diesel knock. Vibration through the boat at idle has almost vanished. Fuel color has gone from dark brown two months ago to light amber. There are no "globs" coming out the fuel drain.
